Countersign

Execution evidence

Real on-chain transaction hashes for Topic F, each tied to a task and to a line of the hash chained decision log. Transaction hashes prove the mechanism, not a market.

TEAM NAME	Countersign
COMPETITION TRACK	International AI Track, Topic F (Agent Wallet)
SUBMISSION DATE	20 October 2026
LINKS	`countersign-web-rt1a.onrender.com` · `github.com/ceciliagalvaoo/Countersign` · `ceciliagalvaoo.github.io/Countersign`

SECTION 01

01 Evidence Summary

SELECTED TOPIC AND SCENARIO

Topic F, Agent Wallet. The scenario: an investor who holds USDC lets an AI agent buy units of receivables funds within a mandate she signed; her first purchase in each fund needs her signature on a decoded card, and the fund's issuer countersigns every mint.

WHAT THE EVIDENCE DEMONSTRATES

> Transaction hashes prove the mechanism, not a market.

Network: Stellar testnet only (test assets; no mainnet transaction in this file). Generated 2026-10-19T10:25:45.650Z by `npm --prefix tests run evidence`. The wallet contract is ours and not audited.

- Transactions in the evidence table: 158; each has a task and a decision-log line.
- Agent purchases (subscribe) checked: 37; decision argument equal to the hash of an APPROVED decision-log line with the same amount: 37.
- Decision log, disposable e2e database (countersign_test, port 55432): chain verified (105 rows recomputed, head 6e4ebd31a7f7...).
- Decision log, disposable suites database (countersign_suites, port 55432): chain verified (122 rows recomputed, head 0a16c9ae0f4c...).
- Decision log, team database (read through the API as the demo investor): chain verified (API verify: 14 rows; her 8 rows recomputed locally).
- Decision log, team database (read through the API as the fund manager): chain verified (API verify: 14 rows; her 6 rows recomputed locally).
- Refused on-chain by design, no decision-log line (listed below): 36. Setup transactions (not evidence, listed): 37. Known gaps (listed, not counted): 0.
- Divergences: 0.

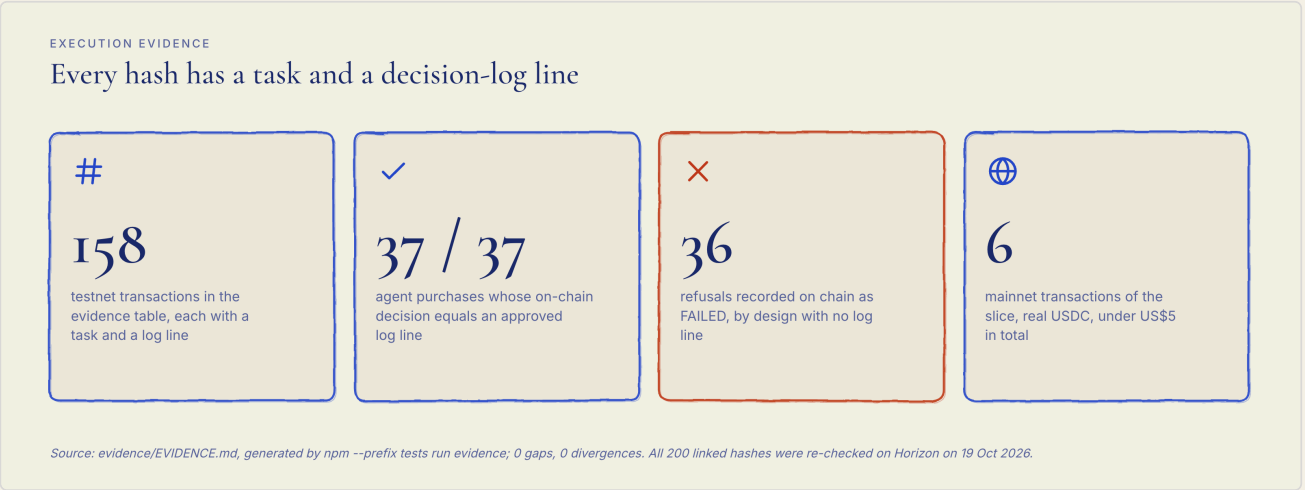

Figure 1. Evidence in numbers.

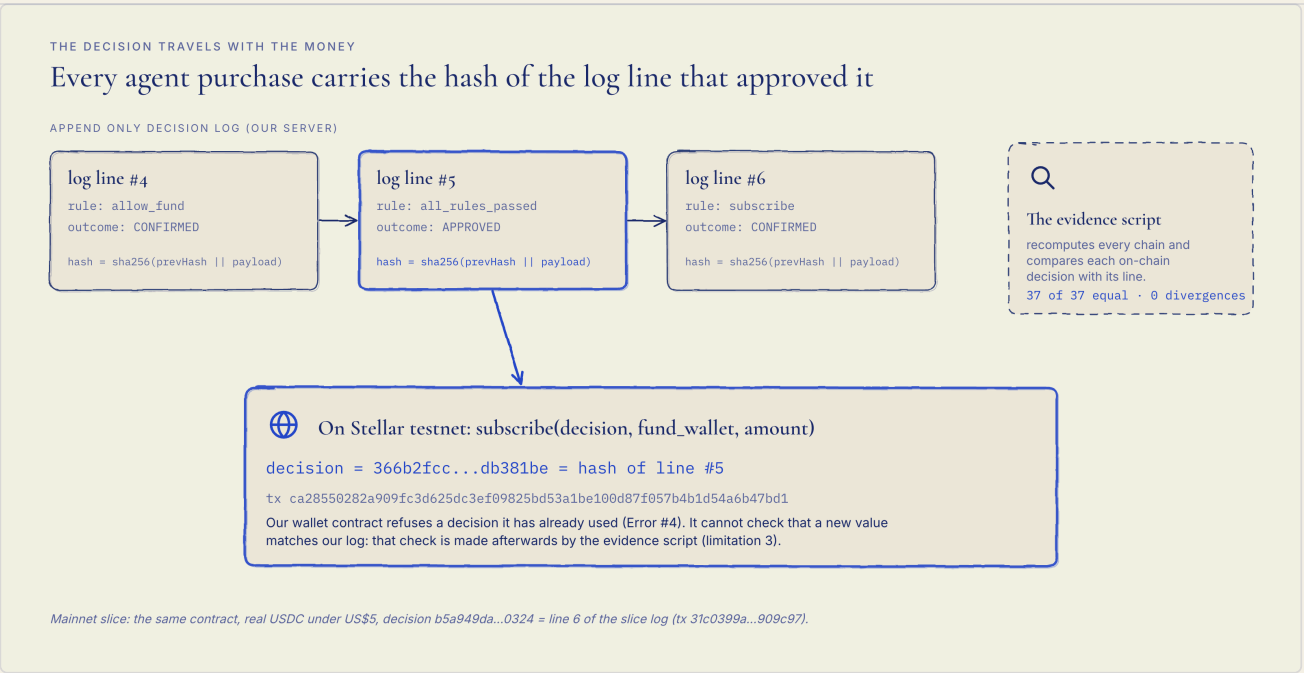

Figure 2. Each agent purchase carries the hash of the decision-log line that approved it.

Selected transactions (the purchase made through the app, its countersignature, an end to end run and a contract refusal):

ACTION	RESULT	DECISION-LOG LINE	HASH
Agent `subscribe` from the investor's mandate wallet, made through the UI	SUCCESS	Line #5 (`all_rules_passed`), = `decision` on-chain; the purchase itself is line #6	`ca285502...b47bd1`
Issuer `mint` of 5 units to that mandate wallet (countersignature)	SUCCESS	Line #8	`b9d1ad65...16674d`
Agent `subscribe` (end to end run a40494)	SUCCESS	e2e #91; decision = line #90	`40a2a96a...923676`
Issuer `mint` to the mandate wallet (run a40494)	SUCCESS	e2e #93	`e432ab1b...59180f`
A03: agent key pays a wallet outside the allowlist	FAILED, refused by our wallet contract	none by design: the request bypassed our server	`cfff9ced...3a3b5c`

Mainnet slice (from the README; the table in section 02 covers the test network only; real USDC, less than US$5 in total):

STEP	TIMESTAMP (UTC)	RESULT	MAINNET SLICE LOG LINE	HASH
Upload of the `mandate-wallet` Wasm	2026-10-19T00:50:38Z	SUCCESS	#1	`999f0b0d...7ec207`
Deploy of the fund unit token (Stellar Asset Contract of a team-issued test asset)	2026-10-19T00:52:08Z	SUCCESS	#2	`285f5eda...e38a12`
Owner deploys her mandate wallet (caps and mandate hash)	2026-10-19T06:58:28Z	SUCCESS	#3	`f8a97c65...ccddaa`
Owner deposits 4 USDC	2026-10-19T07:13:48Z	SUCCESS	#4	`82aaf6cd...dae56d`
Owner `allow_fund` (fund wallet controlled by the team)	2026-10-19T07:38:03Z	SUCCESS	#5	`a377f7b1...cad19b`
Agent `subscribe` of 4 USDC, signed by the agent key	2026-10-19T07:40:08Z	SUCCESS	#7; decision = line #6	`31c0399a...909c97`

Mandate wallet on mainnet: `CAIUDASJVR5XHXQDGBKDFUYGNL7BQJAQPWLBCA4OFHSYYVFL7GP34HVV`. The `decision` argument of the agent's `subscribe` is `b5a949daddd3e3d8fd88caea696f30fdd2075afd230fe6f88477d7d70fdf0324`, the hash of line 6 (APPROVED, `all_rules_passed`) of the slice's own decision log (`scripts/mainnet/out/decision-log.jsonl`, 7 lines, same serialization and hash chaining as the API). The log's label, literally: "mainnet slice: the fund unit token is a team-issued test asset (Stellar Asset Contract); the purchase proposal was entered by the operator and decided by our policy code; the issuer countersignature is demonstrated on testnet". Every amount is real USDC, less than US$5 in total.

1d0f0b5f70...690635	2026-10-18T15:25:07Z	mint	FAILED	e2e run a40494 (scripts/e2e, CLI identities): mint(C) while paused	no decision-log line by design: the mint was sent while the fund wallet had paused the FundToken; refused by the FundToken contract on Stellar (not audited)	stellar.expert

For these, "transaction failed on-chain" is consensus; the contract error number comes from the RPC diagnostic events of the suite run.

Setup transactions (not evidence)

37 transactions: test or account setup (friendbot, faucet, trustline, dedicated test wallet of the bypass cases); not an investor task; fund onboarding: FundToken deploy by the fund wallet (manager flow); the decision log covers

investor tasks. Full list in `evidence/evidence.json`.

SECTION 03

03 Reproduction Guide

STEPS REQUIRED FOR JUDGES TO REPRODUCE OR VERIFY THE EVIDENCE

Verify without running anything: open any link above on stellar.expert (testnet). For an agent purchase, the first argument of `subscribe` is the decision; it equals the hash of the decision-log line shown in the table.

Reproduce: follow `tests/RUNBOOK.md`: deploy the contracts, seed the demo funds, run the API and the agent, then `npm --prefix tests run suites` (suites) and `npm --prefix tests run evidence` (this file). The command recomputes each decision-log chain, reads every transaction from Horizon testnet, decodes it, and fails on any hash without task or log line, any action that differs from its line, any decision that differs, or a broken chain.
